# Bank Account Management System

## Project Title

Bank Account Management System

## Problem Statement

Manual banking systems are slow and prone to errors. Managing balances, withdrawals, and different account rules manually is inefficient and unreliable.

## Target Users

### Small cooperative societies

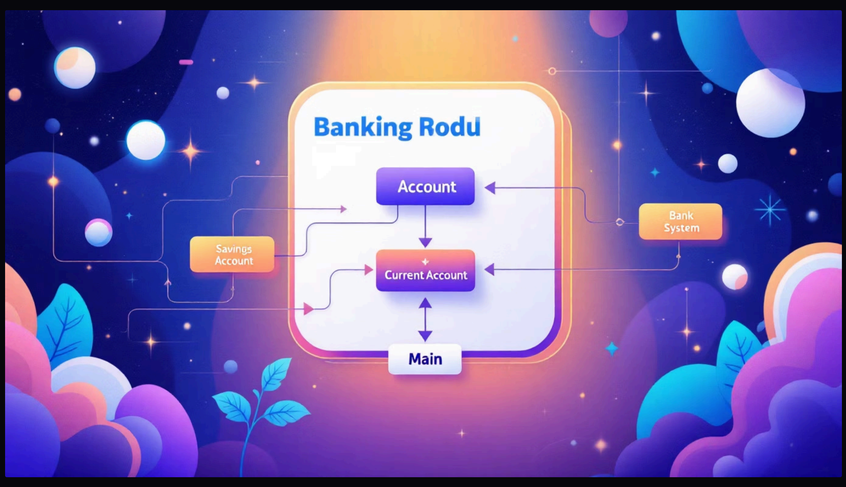
Organizations that need a simple and reliable way to manage shared accounts and transactions.

### Students learning banking systems and OOP concepts

Learners studying object-oriented programming through a practical banking application.

## Core Features

## Proposed Architecture



**Description**

The system follows a modular structure. The Account class acts as the base class, while SavingsAccount and CurrentAccount extend it using inheritance. The BankSystem class manages all accounts using an ArrayList, and the Main class provides user interaction.

## How to Run

Compile Run

Compile all Java files: `javac *.java`
Run the program: `java Main`

## Git Discipline Notes

- Minimum 10 meaningful commits are required
- Each commit represents a logical change
- Commit messages must describe the change clearly
